Art Unit: 2767

DETAILED ACTION

Response to Amendment

1. This action is in response to the amendment filed 23 June 1999 which amended claims 1, 10, 19, 20, 23, 24, and 25.

Response to Arguments

- 2. Applicant's arguments filed 23 June 1999 have been fully considered but they are not persuasive. Regarding claims 21 and 22, applicant argues that Dabbish does not show circuit connections which can be changed. However, applicant does note that the Dabbish's soft logic circuit communicates with an EPE, which is variable and therefore reads on applicant's 21st and 22nd claims.
- 3. Applicant's arguments with respect to claims 1-20 and 23-25 have been considered but are most in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

Art Unit: 2767

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 21-22 are rejected under 35 U.S.C. 102(b) as being anticipated by Dabbish (4972478).

In the abstract, Dabbish discloses a "... logic cryptographic circuit that can be reprogrammed with various cipher algorithms." Reprogramming implies changing means. Changeable deciphering apparatus is mentioned in column 3, lines 44-46. Part 104 on Dabbish's diagram is communication circuitry, meaning that the apparatus can be connected to a communication network. In lines 51-67 of column one, Dabbish states that orders to change the encryption algorithm originate from sources external to the apparatus.

Claim Rejections - 35 USC § 103

- 6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 1, 5, 8, 10, 14, 17, 19, 20, and 23-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish.

In the abstract, Dabbish discloses a "... logic cryptographic circuit that can be reprogrammed with various cipher algorithms." Reprogramming implies changing means.

Application/Control Number: 08814409 Page 4

Art Unit: 2767

Changeable deciphering apparatus is mentioned in column 3, lines 44-46. Part 104 on Dabbish's diagram is communication circuitry, meaning that the apparatus can be connected to a communication network. In lines 51-67 of column one, Dabbish states that orders to change the encryption algorithm originate from sources external to the apparatus. Dabbish does not say that the structure of the algorithms is changed. Official notice is taken that cryptographic hardware is faster than cryptographic software. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to make the programmability of Dabbish based upon hardware modification in order to achieve greater speed.

8. Claims 2-4, 6, 11-13, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish in view of Jovanovich et al. (5703950).

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the algorithm itself come from sources external to the circuit. Dabbish does not disclose configuration means, a compiler, libraries, databases, or mapping data objects. He further does not disclose that the cipher algorithm is encrypted. Official notice is taken that it is old and well-known to encrypt data so as to prevent it from being used by parties other than the intended recipient. Official notice is also taken that object oriented programming is old and well-known. In lines 58-64 of column 3, Jovanovich et al. talk about storing data in a database. The data is compiled by configuration means. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to store cipher algorithms in a database from

Application/Control Number: 08814409 Page 5

Art Unit: 2767

which configuration means would compile an algorithm and write it, as an object, to the circuit. In object-oriented programming, libraries containing data are common. It would also be obvious to encrypt data that is sent to the circuit. This would protect the data, foiling those who would otherwise have intercepted the data and created their own identical circuit. It would also act to disallow sending false data to the circuit. Data that was not encrypted according to a key in the circuit would not create an intelligible algorithm. Finally, it would protect the new circuit specifications while minimizing use of keys used to decrypt messages. This advantage is similar to the advantages of session key use as opposed to master key use.

9. Claims 7 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish.

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the algorithm itself come from sources external to the circuit. Dabbish does not say that the algorithms are updated on a periodic basis. Official notice is taken that updating keys or other cryptographic devices is old and well-known. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to allow for periodic updates of the circuit, making it particularly useful in time specific applications such as pay television systems.

10. Claims 9 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dabbish in view of Lynn et al. (5345508).

Dabbish presents a system in which ciphering algorithms are written to a circuit, thus changing the algorithm that the circuit follows. The instructions to change the algorithm and the

Application/Control Number: 08814409

Page 6

Art Unit: 2767

algorithm itself come from sources external to the circuit. Dabbish does not mention changing the circuits specifications based upon the communication path, degree of communication path security, or the process speed required. Lynn et al. talk about changing encryption keys based upon processing time and security. They specifically describe how their invention can be used to balance these factors in the first paragraph of the brief summary, line 54 of column 2 through line 36 of column 3. Therefore it would have been obvious to a person of ordinary skill in the art at the time the invention was made to allow for changes in the circuits specifications based upon the communication path, degree of communication path security, or process speed required. This would give flexibility to the system, letting it adapt to security and speed requirements.

Conclusion

11. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 2767

however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Douglas Meislahn whose telephone number is (703) 305-1338. The examiner can normally be reached Monday-Thursday and every other Friday from 8:30 AM to 6:00 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Tod Swann, can be reached at (703) 308-7791.

The fax number for Formal or Official faxes to Technology Center 2700 is (703) 308-9051 or 9052. Draft or Informal faxes for this Art Unit can be submitted to (703) 305-0040.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (703) 305-3900.
